

Insurance COI Triage

Every certificate request is read, checked against the client's coverage and answered with a drafted reply, so your service team approves instead of writing. Nothing goes out on its own.

Designed by Jonathan Munteanu

15 → 2 MIN

per COI request, inbox to approved reply

Based on 100 requests a month at ~15 minutes each by hand

ILLUSTRATIVE

THE PROBLEM

A client emails for a certificate. Someone opens the request, finds the policy, checks the wording against what the client asked for, spots whether a gap needs a call to the carrier, then writes the reply and attaches the right document. It lands between other work, so it waits, and the client waits with it.

HOW IT WORKS

WHAT YOU GET

15 → 2 min

per request, from inbox to a reply ready to approve

1 view

request, coverage and gaps side by side

Every gap

flagged before a certificate goes out

0

replies sent without a person approving

GUARDRAILS

- Nothing sends on its own. Every reply is a draft your team approves.
- Honest about gaps. Anything that doesn't match the coverage on file is flagged, not guessed.
- Your records, your rules. It reads only the policies and templates you point it at.

WHAT THE SYSTEM DOES

- Watches the inbox for certificate requests
- Reads each request: holder, wording and what is being asked for
- Checks it against the client's coverage on file
- Flags any gaps for a person before anything is promised
- Drafts the reply for your service team to approve

BUSINESS VALUE

ILLUSTRATIVE ROI

If handling a certificate request takes about 15 minutes by hand:

100 requests a month ≈ 25 hours

That's more than three full workdays a month back, about \$15K a year in service-team time, and clients hear back the same hour instead of the same day.

Illustrative math, not a measured client result.

CUSTOMIZABLE FOR YOUR BUSINESS
